

Task 1.1 P

Get a phrase from user, split the words of that phrase and print the words.

The image shows a Jupyter Notebook interface with a single code cell. The code prompts the user to enter a phrase, splits it into words, and prints each word on a new line. The output shows the user input "I'm studying at clora campus." and the resulting words printed on separate lines.

```
[In 1]: # ask the user to type a phrase:
phrase = input("please input a phrase: ")

# split the one phrase into words
words = phrase.split()

print new line for each word
for word in words:
    print(word)

please input a phrase: I'm studying at clora campus.
I'm
studying
at
clora
campus.
```
